Dr. ylj Semc.

Miggy 7

Sam obtained his Ph.D. in School Psychology from the University of Utah and is licensed as a Psychologist and Certified School Psychologist in the State of Utah. He is also board certified as a Pediatric Neuropsychologist and listed in the Council for the National Register of Health Service Providers in Psychology. He is a Fellow of the American Psychological Association and the National Academy of Neuropsychology. Sam is an Adjunct Assistant Professor in the Department of Psychiatry at the University of Utah School of Medicine. He has authored, co-edited, or co-authored over 50 clinical and trade publications, three dozen chapters, nearly three dozen peer-reviewed scientific articles, and eight psychological and neuropsychological tests. He is in development for a behavioral assessment tool to evaluate DMDD, a new interactive test for ASD, and is editing a clinical volume about DMDD. Sam is the Editor in Chief of the *Journal of Attention Disorders*. Since 1980, he has served as the Clinical Director of the Neurology, Learning, and Behavior Center in Salt Lake City, Utah.

3

Presentation Objectives

- 1. This session will help participants develop an appreciation and insight to formulate an assessment battery to determine IDEIA and ADA eligibility for young children with ASD as well as complete a comprehensive assessment of a young child with suspected ASD.
- 2. Participants will acquire knowledge needed to understand the role the Battelle Developmental Inventory 3 can serve in a school-based or community assessment of young children with ASD.
- 3. This session will help participants gather data, make diagnoses, determine eligibility and formulate educational goals for young children presenting with ASD and accompanying developmental delays.

4

NASP Domains

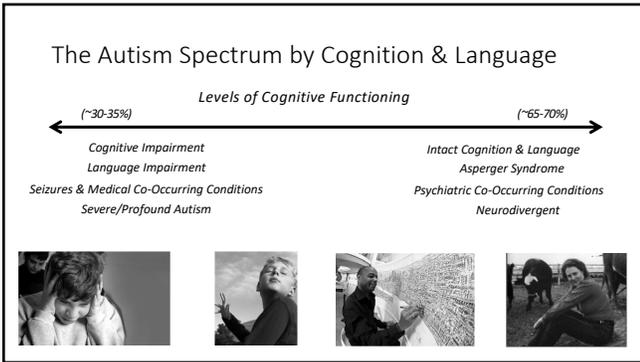

- *Domain 1: Data-Based Decision Making*
- *Domain 4: Mental and Behavior Health Services and Interventions*
- *Domain 9: Research and Evidence-Based Practice*

5

Broadening the Spectrum

- Eleven meta-analyses published between 1966 and 2021.
- 27,723 total subjects from around the world.
- Five psychosocial dimensions: emotion recognition, theory of mind, cognitive flexibility, planning and inhibition.
- For all 5 dimensions group differences between normal and those with ASD have declined since 2000.
- This is generally attributed to differences in diagnostic criteria, assessment practices and community awareness.

6

7

Current Statistics on Autism (CDC)

IN THE GENERAL POPULATION:

- 1 in 44 8-year-old children are identified with ASD
- Male-Female Ratio:
 - 4 times higher in boys
- Median Age of Diagnosis: 4-5 years
 - Much later for disadvantaged populations
- When ASD can be reliably diagnosed:
 - 18-24 months when diagnosed by experienced clinicians
- Co-Occurring Intellectual Disability:
 - 35% with ID

GENETIC LIABILITY:

- ASD in Subsequent Biological Siblings: 1 in 5 (~20% risk)
- Broader Autism Phenotype ("shadow symptoms"): 1 in 5 Siblings
- Non-ASD developmental delays: 1 in 10 Siblings

8

Autism in Females

- Females often misdiagnosed or missed to diagnosis
- Females may present with stronger social skills (Kreiser & White, 2014):
 - Intact symbolic and imaginary play
 - Larger emotional vocabulary
 - Greater awareness and desire for social interaction
 - Ability to mimic others in social situations
 - May develop one or two close friends
- Restricted interests tend to be related to people/animals rather than inanimate objects (Lai & Baron-Cohen, 2015)
- Research points to a "protective effect" in females (Satterstrom et al., 2020)
- "Camouflaging Effect": Females are more likely to use coping strategies to hide ASD behaviors – likely due to social pressures (Hull et al., 2017)
- Higher rates of internalizing disorders (anxiety, depression, eating disorders)

Females on the Autism Spectrum

Behaviour
 Less prone to act out physically or aggressively
 More prone to internalize distress (often manifesting as anxiety or obsessive-compulsive disorder)
 Absence of obvious when there are changes in routine
 Obscure human behaviour, learning to mask differences
 Practice rituals that appear to have no function
 May play with dolls or toys well beyond the typical age for these items
 Tend to have better performance in certain aspects of her life
 High rate of history of anxiety, eating disorders or self-harm

Communication
 More aware of the need for social interaction
 May have an exceptional vocabulary
 Tends to mimic rather than providing natural responses
 May continue to use "scripted" speech
 Seem to struggle with non-verbal aspects of communication, such as body language and tone of voice
 May use self-defence
 May appear to have difficulty dealing with unexpected social responses
 May be able to follow social rules through observation
 Usually has one or two close friends at school
 May have difficulty forming a relationship with family or friends
 May make greater efforts to avoid shared attention to themselves
 Appears especially shy or avoids interacting with others or making eye contact socially
 Can be quite successful in play
 Seem uncomfortable during interactions. Can struggle with eye contact
 Often "withdraw" by return to primary school but bullies in high school
 May play cooperatively with toys and appear to pretend play at home (focus on organizing objects or toys)
 Often shows empathy and compassion but may be confused by non-verbal social signals
 Usually holds it together well when out and exposed at home

Social
 May struggle with social skills
 Often miss socially aware cues
 May struggle with social skills and often appear to be socially awkward
 Often miss socially aware cues
 May struggle with social skills and often appear to be socially awkward

9

Females on the Autism Spectrum

Behaviour

- Less prone to act out physically or aggressively
- Intense focus on a particular subject, often involving animals or classic literature
- Appears anxious when there are changes in routine
- Observes human behaviour, learning to mask difficulties
- Practices rituals that appear to have no function
- May play with dolls or toys well beyond the typical age for these items
- Tendency toward perfectionism in certain aspects of her life
- High risk of having episodes of eating disorders and self medication

Communication

- More aware of the need for social interaction
- May have an exceptional vocabulary
- Tends to mimic rather than providing natural responses
- May converse in predictable, "scripted" ways
- Seems to struggle with non-verbal aspects of communication, such as body language and tone of voice
- May use odd inflection
- Appears to have difficulty dealing with unexpected verbal responses
- More able to follow social actions through observation

Social

10

Stimming behaviors, such as hand flapping, rocking, or spinning can appear much milder. They can also be internalised/thoughts instead of external behaviours

May apologise and appease when they make a social error

Often more socially aware and driven

Often present with many of these traits, just like females can present with the more male type traits. It is called a female presentation because it is more commonly seen amongst females on the autism spectrum

Usually has only one or two close friends at school

May have difficulty fitting in due to clothing and hairstyle choices

May make greater efforts to avoid drawing attention to themselves

Appears excessively shy or avoids interacting with others or making the first move socially

Can be quite controlling in play

Seems uncomfortable during conversation. Can struggle with eye contact

Often "mothered" by others in primary school but bullied in high school

May play appropriately with toys and engage in pretend play or may focus on organizing objects or toys

Often shows empathy and compassion but may be confused by non-verbal social signals

Usually holds it together well while out and explodes at home

11

Racial & Ethnic Disparities

www.cdc.gov/ncbddd/autism/addm

- Prevalence rates are **FINALLY** identical for non-Hispanic white, non-Hispanic black, and Asian/Pacific Islander children but continue to be **LOWER** for Hispanic children
- 47% of Black children and 36% of Hispanic children are more likely to have Intellectual Disability with ASD compared to 27% of White children
- Black children with ASD are less likely to have a first evaluation by age 3 than White children

Which children were more likely to be identified with ASD?

Boys were 4 times more likely to be identified with ASD than girls.

White children were still more likely to be identified with ASD than black or Hispanic children. Black children were more likely to be identified with ASD than Hispanic children. However, these differences were smaller when compared with estimates from previous years.

1.1x MORE LIKELY among white vs black children

1.2x MORE LIKELY among white vs Hispanic children

1.1x MORE LIKELY among black vs Hispanic children

12

Development of Play Skills in Autism

- Sensory-Exploratory Play – Pro-longed in ASD
 - Mouthing/dropping/manipulating objects
- Cause-and-Effect Play – Perseverative in ASD
 - Push-button & musical toys
- Functional Play – Impaired (e.g., lining up; visual peering; fixation on parts)
 - Using a toy for intended purpose (e.g., “driving” a car; “talking” on a phone; building with blocks; feeding a baby)
- Symbolic & Imaginary Play – delayed/prolongued (females) or absent in ASD
 - Using a toy for a novel purpose (e.g., using a block as a phone)
 - Using miniature figurines as agents (e.g., “mommy” feeding the baby)

Predictors of Outcome
Jones, Carr, & Klin (2008; Arch Gen Psychiatry)

Fixation Time on Eye Region, %

ADOS Social Algorithm Score

Increasing social disability

Less fixation time on eyes predicts more severe social disability.

Neurodevelopmental Assessment & Consulting Services 17

17

Key Assumption:

Children with ASD master a series of early social and related developmental tasks in a reliable sequence, corresponding to that seen in typically developing children.

But they are delayed, often requiring direct instruction to acquire a range of skill and behaviors others develop through experience alone.

18

Key Assumptions

Sensory motor differences precede the unfolding of cognitive and adaptive deficits, as well as behavioral features of ASD across a six-to-twenty-four-month old interval.

The less severely affected group with ASD demonstrate later symptom onset in the second year of life with initial differences in the social communication domain.

19

What are some measurable abnormalities of development that might demonstrate themselves in characteristic patterns of social and communicative behavior?

- 1. The ability to attribute mental states to one's self and others.
- 2. The ability to display an emotional reaction appropriate to another person's mental state (joint attention of emotion).
- 3. The ability to plan and attend to relevant details in the environment.

20

What are some measurable abnormalities of development that might demonstrate themselves in characteristic patterns of social and communicative behavior ?

- 4. The ability to understand the communicative content of gaze.
- 5. The ability to work cooperatively with others (share joint attention of behavior).
- 6. The ability to understand, comprehend, analyze, synthesize, evaluate and differentiate in particular, social information in his environment.

21

Diagnostic Evaluations for Autism are Comprehensive!

- Screeners for Risk and Need for Evaluation
- Developmental History
- Assessment of Developmental or Cognitive Skills
- Speech, Language, & Communication Assessment
- Adaptive Behavior Assessment
- Assessment of Autism Symptomatology
- Assessment of Executive Functioning
- Assessment of Emotional/Behavioral Regulation Skills

22

Assessing Autism Symptomatology

Screeners

- Identifying risk factors for ASD
- Detecting red flags that require further evaluation

Ratings

- Parent report / School Report
- Rating Scales/Questionnaires

Direct Assessment

- Direct observation of child with/without structure
- Probe language, social, play skills
- Observe atypical/stereotypical behaviors

23

Autism Diagnostic Observation Schedule, Second Edition (ADOS-2)

5 Modules based on age and language level

- **Toddler Module:** Between 12 and 30 months with no phrase speech
- **Module 1:** 31 months + with no phrase speech
- **Module 2:** 31 months + with phrase speech
- **Module 3:** Verbally fluent children & young adolescents
- **Module 4:** Verbally fluent older adolescents & adults

Items Coded on 4-point severity scale

- 0 = symptom not present
- 3 = symptom severe/atypical

Diagnostic Algorithm for Modules 1-4:

- Autism
- Autism Spectrum
- Non Autism Spectrum

ADOS-2

Lord et al., 2012

24

Clinician Best Estimate (CBE)

- Most grants currently follow best-practices of using a CBE by 1 or 2 experienced clinicians that incorporates data from a variety of assessment sources (e.g., developmental history, ADOS-2, ADI-R, ASRS, cognitive findings, etc.)
- CBE typically trumps any single measure's algorithm/cut-offs, although some studies may still require minimum cut-offs
- No single measure diagnoses autism. Clinicians diagnose autism.

25

26

		Developed in 1973 at the Battelle Memorial Institute Columbus Laboratories by Jean Newborg.
		Project was initiated by the U.S. Department of Education to provide a uniform measure of developmental progress and to evaluate effectiveness of federally funded Early Childhood Education Programs
Type	Private Nonprofit Charitable Trust	Currently, practitioners across all 50 states use the BDI for special services eligibility. Sixteen states use the BDI as a preferred state assessment and anchor tool
Industry	National Security, Healthcare, Environment	
Founded	Columbus, Ohio (1929)	
Headquarters	Columbus, Ohio, USA	
Key people	Linis Von Thase, President and CEO	
Services	Research & Development, Engineering Services	
Revenue	US\$2.2 billion**	
Number of employees	3,200 (+29,500 from national labs)	
Website	www.battelle.org	

27

Battelle Developmental Inventory 3

The new Battelle Developmental Inventory (BDI 3) is a comprehensive assessment that measures 6 areas of developmental milestones including:

- Social Emotional (Personal-Social)
- Communication
- Adaptive
- Motor
- Cognitive
- Battelle Early Academic Survey

Battelle 3 is the only assessment on the market that measures these domains from birth to 7 years 11 months. It is the most comprehensive assessment on the market for early childhood and is widely used by early childhood evaluators.

28

28

Standardization and Norms of BDI-3

2500 children completed the Adaptive, Cognitive, Communication, Motor and Social-Emotional domains from 20 age groups with 100 children in each group

Special Group Studies were performed for BDI 3 Standardization

- Autism
- Cognitive Delay
- Motor Delay
- Premature Birth
- Speech and Language Delay
- Broad Developmental Delay

1000 children completed the Spanish Developmental Battery assessment in 20 age groups.

1000 children completed the Battelle Early Academic Survey assessment in 9 age groups.

29

29

BDI-3 Domains and Subdomains

Social-Emotional Domain	Communication Domain
Adult Interaction	Receptive
Peer Interaction	Expressive
Self-Concept and Social Role	Cognitive Domain
Adaptive Domain	Attention and Memory
Self Care	Reasoning and Academic Skills
Personal Responsibility	Perception and Concepts
Motor Domain	Battelle Early Academic Survey
Gross	Literacy
Fine	Mathematics
Perceptual

The BDI-3 Developmental Screening Test

- Allows you to quickly screen and evaluate early developmental milestones to identify children at risk for developmental delays or disabilities.
- Requires no more than 30 minutes for a full administration.
- Consists of a subset of test items from each of the 5 BDI-3 domains.
- Requires only 1 Easel book.
- Quickly screen for school readiness.

32

BDI-3 Key Features

- Comprehensive measurement of all developmental areas
- Conceptualization of *developmental milestones*
- Age range of birth through 7 years, 11 months
- Complete assessment and screening test
- Flexible administration options
- Multiple point scoring
- Easy to score
- Norm, curriculum, and criterion reference base

33

33

Broad Applications and Purposes of the BDI-3

Identify the developmental strengths and opportunities for learning of typically developing infants and children.	Identify the developmental strengths and opportunities for learning of children with disabilities in infant intervention, preschool, kindergarten and primary education programs.	Assessing children as part of a comprehensive evaluation considered to be "at risk" in any developmental area such as ASD.
General screening of preschool and kindergarten children.	Monitoring child progress.	Assessing and developing IEP's and Treatment Plans.

Using the BDI-3 as Part of an ASD Assessment Focused on ASD Behaviors

30+ items on the BDI-3 complete have been aligned with the DSM-5 criteria for ASD

Example: Persistent deficits in social communication and social interaction
 → Cross validate ASRS (i.e., smile appropriately?)
 → Look at others when interacting with them?

Example: Restricted, Repetitive Patterns of Behavior, interests and/or activities
 → Cross validate ASRS (i.e., play with toys appropriately?)

49

BDI-3 Scoring & Reporting

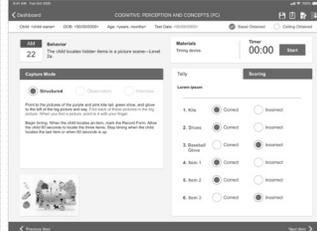

- BDI-3 scoring can be completed through the web-based **Riverside Score** system - a secure, web-based environment where examiners can easily enter raw scores, assessment data, and test session observations.
- [BDI-3 Developmental Complete Sample Report](#)

50

Mobile data solution (BDI-3 MDS)

- Administer the BDI-3 on-the-go using a compatible Windows Device or tablet.
- Use it with any combination of the complete test, screening test or BEAS
- Timer capability
- In-the-moment scoring
- Combines examiner test easel instructions and examiner test record forms
- Reduce human error with basal and ceiling indicators
- Can also use offline & sync back to Riverside Score once internet connection is available

51

Conclusions

- Our focus in ASD definition, diagnosis and treatment is shifting to a disorder of primarily social functioning.
- ASD is a lifespan condition.
- The identification of ASD is shifting to a technology driven assessment of critical biological variables (e.g. eye gaze)
- Children with ASD demonstrate measurable abnormalities in development that can be reliably and validly measured to design individualized treatment.
- The Battelle 3 offers a viable means to assess key developmental areas as part of a comprehensive evaluation for young children with ASD.
